Wilmington & San Pedro, CA

PROJECT DESCRIPTION:

The ExxonMobil Oil Corporation (ExxonMobil) proposes to discharge hydrostatic test water from the removal and replacement of four pipelines in the East Basin Channel, and one pipeline in the Main Channel. The project is located between Sampson Way, San Pedro and Berth 180, Wilmington. Potable water supplied by the City of Los Angeles Department of Water and Power will be used for the hydrostatic testing. The wastewater from the pipeline will be discharged into the Channels.

VOLUME AND DESCRIPTION OF DISCHARGE:

Approximately 10,000 gallons per day of hydrostatic test water will be discharged to the Channels (Latitude: 33° 45' 30", Longitude: 118° 15' 30"). From the Channels, the discharge flows into the Outer Los Angeles Harbor, waters of the United States. The site location plan is shown in Figure 1.

FREQUENCY OF DISCHARGE:

The discharge will be intermittent. The ExxonMobil anticipates conducting the hydrostatic testing in October 2003.

REUSE OF WATER:

The vicinity has no landscaped areas that require irrigation. Since there are no feasible reuse options, the hydrostatic test water will be discharged into the Channels.
